Virtual Agent Triage (Conversational Chat) Use Case

Description

The goal is to support in the routing of tickets towards the right ticket type. Via a chat conversation (VA) the AI agent determines whether it should be an incident, request or link a knowledge article. The user should have a single-entry point and should not have to bother about where to go. Virtual Agent will be supporting in a conversational way, to route the questions of the customer into the right ticket type. Ticket types applicable:

- Incident
- Legal Cases
- Service Request (through a link)
- Knowledge Article (to self-serve issues)

Persona

- End-User
- Service Desk/Legal

Value x Feasibility

Business Justification + KPIs

Business Justification:

- ✓ Reduces ticket re-assignment & routing due to wrong form or assignment group being used. Increasing agent productivity
- ✓ Improved experience/satisfaction for end-user from service delivery will be faster
- ✓ Less pollution on the Incident table, where incidents are created which are actually requests.

KPI:

- First time right rate / lower re-assignment
- MTTR / Average Ticket Handling Time
- Ticket cancellation rate
- Customer Satisfaction (per ticket)

Skills and Capabilities

- Determine ticket type logic
- Conversational Catalog (if supported)
- AI Search with NowAssist (if supported)

Key Stakeholders

- Request/Incident Process Owner
- End-users
- Service Desk
- Service Portal Lead

Prerequisites / Dependency

- Virtual Agent (custom workflow)
- End-user enablement (Arabic support)
- Data Dependencies & Enrichment:
 - Matrix/logic to identify which ticket type to select (Data Dependency)
 - Knowledge Base & Articles (Data Dependency)
 - Historical Incidents (Data Dependency)
- Oracle OCI Infrastructure with GenAI/Orchestration

Deliverables

- Virtual Agent on the portal
- Virtual Agent is routing towards the right form (incident / request / knowledge)
- Set the right category/sub-category, set assignment group, set priority when a ticket is opened

Definition of Success

- 90% of the time the tickets are assigned to the right task type (do comparison with As-Is)
 - 90% of the time the meta data is correctly set (Assignment Group, Category, Priority)
 - End-users are enabled in how to interact with the Service Portal / Virtual Agent and feel that the experience has increased.
- All ticket types are supported

Next steps

- Finalize & sign off design
- Create process diagram of the flow
- Build effort/timeline and agree on commitment
- Initiate project & begin by creating high level solution design
- Implement (ServiceNow + Oracle)

Virtual Agent Triage (Conversational Chat) Readiness

Score: 1/5 (Not Ready)

Situation

An AI Agent can determine the appropriate ticket type through conversational interaction with end users by leveraging existing catalog structures, historical tickets, and knowledge content. While the core data prerequisites exist, achieving consistent accuracy depends on mature portal design, clear routing logic, historical data and well-defined categorization rules, requiring careful configuration.

Pre-
Requisites

Pre-requisite	In place
Virtual Agent Workflow/Conversation (Routing Matrix)	☐
Oracle Infrastructure Setup (LangChain, OCI Function, RAG Architecture, LLMs)	☐
Knowledge Articles, Historical Data & Accurate Incident/Case Data (Vector DB)	☐
Technical Design Document (HLD) & Process Flow	☐
Data Governance Model & Approach	☐

Value

- Reduced ticket re-assignment and incorrect routing
- Faster ticket handling and improved MTTR
- Higher first-time-right ticket creation rates
- Improved end-user experience through an easy-to-use chat interface
- Reduced noise from misclassified incidents and requests

Dependencies

- Knowledge Management & Historical Data
- Virtual Agent Conversation/Workflow
- Oracle Setup (LangChain, OCI Functions)
- Oracle Database 23ai (Vector/Session Store)

Custom Approach Considerations

- Choice of LLM is **Cohere Command R+** for reasoning
- **OCI Function** needs to handle truncating large data & OCR.
- **LangChain** Setup & maintenance required to scale AI Agent
- **Historical Data** needs to be ingested and will require **validation/cleanup** to ensure accuracy.

Risk/Challenges

- **Latency Risk** with Oracle API Gateway
- **Maintainability & Scalability** of OCI Functions & RAG Architecture
- **OCI GenAI Agents** not available on-prem, will need to setup LangChain
- **Data Governance**

Legal Case Summarization Use Case

Description

Uses GenAI to generate concise summaries of legal cases enabling legal teams and management to quickly understand case progression without reviewing the full record. Data points that will be used in the summary include: short description, description, state, assigned to/group, and attachments

This capability supports informed decision-making and oversight in legal cases, based on the attributes that are available.

Skills and Capabilities

- Summarization workspace component
- Service Operational Workspace
- GenAI Model for Summarization

Deliverables

- AI-generated summary integrated into ticket details. Including key attributes, attachments, and related records.
- Every update to the ticket conversation/attachment should trigger the updated summary
- Allow for Manual Summary to be triggered (ad-hoc)

Persona

Legal representatives, Legal Affairs Manager

Value x Feasibility

Position the marker to show where the use case sits in terms of Value (impact) and Feasibility (ease). Fill in below:

Type: Productivity
Feasibility: Medium
Value: Low

Key Stakeholders

- Head of Legal Affairs
- Legal Affairs Management

Definition of Success

- Reduction in time to understand legal case context
- 95% of legal cases include AI-generated summaries with minimal edits.

Business Justification + KPIs

Business Justification:

- ✓ Reduces the time required to understand legal case context and supports faster, more informed evaluations by Legal Affairs leadership, while maintaining compliance and auditability.
- ✓ Improves collaboration and knowledge sharing across teams

KPI:

- Reduced time to understand legal case context (Total handling time)
- Improved productivity of legal representatives and legal affairs management
- Faster decision-making and case evaluation cycles

Prerequisites / Dependency

- Build custom GenAI Components within Legal Case Workspace
- Data Dependencies & Enrichment:
 - Define legal case attributes to include in summarization
 - Include related tables/artifacts
 - Review attachment types and logic for summarization
- Oracle OCI Infrastructure with GenAI/Orchestration

Next steps

- Finalize & sign off design
- Create process diagram of the flow
- Build effort/timeline and agree on commitment
- Initiate project & begin by creating high level solution design
- Implement (ServiceNow + Oracle)

Legal Case Summarization Readiness

Score: 3/5 (Ready)

Situation

An AI Agent can be applied to summarize legal case records; however, legal case management is implemented as a custom module, which increases implementation complexity. Achieving reliable outcomes would require controlled pilots, and extensive tuning, with a higher time investment relative to the expected value and no guaranteed consistency across cases.

Pre-Requisites

Pre-requisite	In place
Legal Case Management & fields available	☒
Oracle Infrastructure Setup (LangChain, OCI Function, OCR/Doc Intelligence, LLMs)	☐
Technical Design Document (HLD) & Process Flow	☐
Data Governance Model & Approach	☐

Value

- Reduced time required to understand legal case context
- Improved productivity of legal representatives and management
- Faster case evaluation and decision-making cycles

Dependencies

- Legal Case Mgmt. & Attributes
- Oracle Setup (LangChain, OCI Functions)
- Oracle Infrastructure Setup

Custom Approach Considerations

- Preferred Oracle LLM is **Cohere Command R** for summarization tasks
- **Related List data** may post some complexity if we need to send it to the LLM for context.
- **OCI Function** needs to handle truncating large data
- **ServiceNow Upgrade** considerations due to custom implementation

Risk/Challenges

- **Maintainability & Scalability** of OCI Functions
- **OCI GenAI Agents** not available on-prem, will need to setup LangChain
- **Data Governance**

Incident Summarization Use Case

Description

You can quickly learn the details of a record from the summarization generated by GenAI. By reading the record summarization, you can get details about an incident and can save your requester from having to repeat the same information has already been provided.

The incident summarization should be available to Service Desk agents, and it is shown in the Service Operations Workspace. We want to be able to copy it to the work notes manually.

The following fields from the incident should be used:
Short description, description, category, sub-category, work notes, comments, priority, SLA, and related records.

Skills and Capabilities

- Incident Summarization Workspace Component
- Service Operations Workspaces
- GenAI Model for Summarization

Deliverables

- Configuration done:
 - AI-generated summary integrated into ticket workflows
 - Every update to the ticket conversation/attachment should trigger the updated summary (or manual trigger)
- Training and enablement provided to stakeholders

Persona

Service Desk Agents

Value x Feasibility

Key Stakeholders

- Service Desk Agents / Engineers
- ITSM Process Owner

Definition of Success

- 95% of incidents include AI-generated summaries with minimal edits.
- Positive feedback from agents on clarity and time savings.
- Improved handover quality and reduced review time.

Business Justification + KPIs

Business Justification:

- ✓ Reduces time spent reading lengthy incident logs (history, emails, attributes, related lists etc..).
- ✓ Improves collaboration and knowledge sharing across teams.

KPI:

- Mean time to resolve
- Reduced handling time per incident
- Increase in agent efficiency during shift handovers

Prerequisites / Dependency

- Build custom GenAI Components within Service Operation Workspace
- Data Dependencies & Enrichment:
 - Define incident attributes to include in summarization
 - Include related tables/artifacts
 - Review attachment types and logic for summarization
- Oracle OCI Infrastructure with GenAI/Orchestration

Next steps

- Finalize Design & Feasibility
- Create Process diagram
- Validation Functional & Technical Requirements
- Align on priority against overall AI Strategy roadmap

Change Request/ Risk Summarization Use Case

Description

Uses GenAI to generate concise summaries of change requests, highlighting key risk factors, change details, and current status. This enables Change Managers and Approvers to quickly understand the impact and risk of a change without reviewing lengthy records or attachments.

The summarization provides a consolidated view of change history, risk indicators, approvals, and related context to support faster and more accurate decision-making.

Skills and Capabilities

- Change & Risk Summarization Workspace Component
- Service Operational Workspace
- GenAI Model for Summarization

Deliverables

- AI-generated summaries available on change request records
- Risk factors and status easily highlighted for approvers.
- Refinement based on approval feedback and accuracy tuning

Persona

Change Managers, Change Approvers

Value x Feasibility

Position the marker to show where the use case sits in terms of Value (impact) and Feasibility (ease). Fill in below:

Type: Productivity
Feasibility: Medium
Value: Low

Key Stakeholders

- Change Managers
- Change Approvers

Definition of Success

- 95% of changes include AI-generated summaries with minimal edits.
- 25% reduction in approval review time
- Improvement in consistency and quality of change decisions

Business Justification + KPIs

Business Justification:

- ✓ Reduces the time required to assess change requests and improves the accuracy of risk evaluation by presenting summarized insights at the point of decision-making.

KPI:

- Reduced time to assess change requests
- Improved accuracy in risk scoring
- Faster change approval cycle through summarized insights

Prerequisites / Dependency

- Build custom GenAI Components within Service Operation Workspace
- Data Dependencies & Enrichment:
 - Define change request attributes to include in summarization
 - Include related tables/artifacts
 - Review attachment types and logic for summarization
- Oracle OCI Infrastructure with GenAI/Orchestration

Next steps

- Finalize Design & Feasibility
- Create Process diagram
- Validation Functional & Technical Requirements
- Align on priority against overall AI Strategy roadmap

Knowledge Article Summarization Use Case

Description

Enable end users and support agents to quickly browse and consume knowledge content through AI-generated summaries and personalized responses. AI assists in condensing long articles, highlighting key steps, and improving content clarity for faster understanding and reuse.

Knowledge Bases that can be considered include:

1. ITSM (Service Desk Agents)
2. Legal (Agents)
3. Customer Service (End Users)

Persona

Service Desk, Call Center Agents, end users

Value x Feasibility

Position the marker to show where the use case sits in terms of Value (impact) and Feasibility (ease). Fill in below:

Type: Productivity
Feasibility: Medium
Value: Low

Business Justification + KPIs

Business Justification:

- ✓ Increases self-service effectiveness, reducing dependency on support teams.
- ✓ Improves the quality, clarity, and relevance of knowledge articles.
- ✓ Reduces effort and time spent reviewing and maintaining content.

KPI:

- Improved quality and relevance of knowledge articles.
- Faster article creation and review cycles.
- Increased self-service adoption and reduced ticket volume.

Skills and Capabilities

- Knowledge Article Summarization Component in Service Portal & Workspace UI's
- AI-assisted content generation & refinement
- Service Portal (ESC)
- Service Operational Workspace
- GenAI Model for Summarization

Key Stakeholders

- Knowledge Managers
- Service Desk Lead
- Internal Communications Lead
- Legal Lead

Prerequisites / Dependency

- Knowledge Management module enabled
- Identified knowledge owners and approval workflows
- AI summarization enabled for knowledge content
- Published Knowledge Articles to be summarized
- Oracle OCI infrastructure with GenAI/RAG/Orchestration

Deliverables

- AI-generated summaries for existing knowledge articles
- Updated review and validation workflows
- Training and enablement for knowledge stakeholders

Definition of Success

- Reduction in time spent reviewing or consuming knowledge articles
- Increase in self-service resolution driven by knowledge usage
- 95% in all lengthy articles include a summarized version

Next steps

- Finalize Design & Feasibility
- Create Process diagram
- Pilot with selected knowledge bases
- Align on priority against overall AI Strategy roadmap

Document Intelligence (Summarize Attachments) Use Case

Description

Uses AI to analyze and summarize the content of attachments directly within ServiceNow, enabling agents and managers to quickly understand key information without downloading or opening files.

This can be applied to multiple record types, including:

- Incidents
- Requests
- Legal Cases

Persona

Call Center Agents / Service Desk, Legal Specialists

Value x Feasibility

Position the marker to show where the use case sits in terms of Value (impact) and Feasibility (ease). Fill in below:
Type: Productivity
Feasibility: Medium
Value: Low

Business Justification + KPIs

Business Justification:

Reduces time spent reviewing lengthy attachments and accelerates decision-making by surfacing key insights directly within records.

KPIs:

- Reduced time to review attachments
- Improved decision-making speed
- Faster change approval cycles

Skills and Capabilities

- Custom document Intelligence (AI OCR) component
- AI-based attachment summarization
- Gen AI models for content analysis (OCR/Vision)

Key Stakeholders

- Operation managers
- ITSM Process Owners
- Legal Affairs Manager

Prerequisites / Dependency

- Custom Document Intelligence Component
- Access to attachments (Knowledge articles, Legal Policies, etc..)
- AI model configuration for summarization
- Oracle OCI Infrastructure with GenAI/Orchestration

Deliverables

- AI-generated summaries of attachments available directly on records
- Enhanced summarization accuracy with contextual tuning and feedback
- Allow attachments to be manually summarized when needed

Definition of Success

- Faster review of attachment-heavy records with 80% containing summaries
- Improved knowledge accessibility
- Quicker and more confident approval decisions

Next steps

- Finalize & sign off design
- Create process diagram of the flow
- Build effort/timeline and agree on commitment
- Align on priority against overall AI Strategy roadmap

Thank you!
